

Circularity report : TROUSERS

The Evo nylon used here is a bio-based fibre from Fulgar, made from castor oil rather than petroleum. It's an ultralightweight fibre that cuts fabric weight by 25% versus equivalent polyester, dries 50% faster than standard polyamide 6,6, and has notably high elasticity a genuine win on raw material sourcing, shifting away from fossil feedstock. But the 5% elastane content is a problem at end-of-life: elastane above roughly 5% becomes a major obstacle to mechanical recycling because the fabric resists the rollers used in fraying, and separating blended fibres is complex and expensive, removing much of the incentive to recycle rather than produce virgin material. So bio-based origin doesn't solve the recyclability issue, these are two separate parts of the lifecycle. The RiRi zip is the standout: RiRi was the first in the fashion accessories industry to make 100% recycled, post-consumer polyester the standard for zip tapes, cutting polyester production emissions by 32%, and it's GRS and Oeko-Tex certified.
